

**In the specification:**

Please add the following paragraph to the detailed description of the invention section:

12. It is possible to package together, all of the elements required to measure the binding of a ligand to a surface using this method. Thus, the end user would be presented with all of the needed materials at once. The labeled and unlabeled ligand, antibodies, substrate, electrophoresis gels, blotting membranes, and blotting reagents could be presented together in order to accomplish this. For example, FITC-insulin, insulin, anti-FITC, horseradish peroxidase-conjugated anti-anti FITC, nitrocellulose membrane(s), blotting block and run solutions, and precast electrophoresis gels and electrophoresis solutions could be packaged together as a kit to evaluate the binding of insulin to cell surfaces
